ABSTRACT OF THE DISCLOSURE

15           The present invention relates to an implantable  
device for continuously administering liquid medication  
to a patient at a very low rate.

          The device of the invention comprises:

20           · a transfer chamber enabling a supply to be fed  
with liquid;

          · transfer means for transferring said liquid  
between the transfer chamber and said supply; and

          · a supply enabling said liquid to be delivered, the  
supply including:

25           · an inlet for receiving said liquid; and

          · at least one outlet for delivering said  
liquid to the patient.
